$$\text{Complex power absorbed by the total load } \bar{S}_{LOAD} = \bar{S}_R + \bar{S}_L + \bar{S}_C = 2000 \angle 53.1^\circ$$

Power Triangle:

Complex power delivered by the source is

$$\bar{S}_{SOURCE} = \bar{V} \bar{I}^* = (100 \angle 0^\circ)(20 \angle -53.1^\circ)^* = 2000 \angle 53.1^\circ$$

The complex power delivered by the source is equal to the total complex power absorbed by the load.

2.26 (a) The problem is modeled as shown in figure below:

$$P_L = 120 \text{ kW}$$

$$pf_L = 0.85 \text{ Lagging}$$

$$\theta_L = \cos^{-1} 0.85 = 31.79^\circ$$

Power triangle for the load:

$$\begin{aligned}\bar{S}_L &= P_L + jQ_L = 141.18 \angle 31.79^\circ \text{ kVA} \\ I &= S_L / V = 141,180 / 480 = 294.13 \text{ A}\end{aligned}$$

$$\begin{aligned}Q_L &= P_L \tan(31.79^\circ) \\ &= 74.364 \text{ kVAR}\end{aligned}$$

Real power loss in the line is zero.

$$\begin{aligned}\text{Reactive power loss in the line is } Q_{LINE} &= I^2 X_{LINE} = (294.13)^2 1 \\ &= 86.512 \text{ kVAR}\end{aligned}$$

$$\therefore \bar{S}_S = P_S + jQ_S = 120 + j(74.364 + 86.512) = 200.7 \angle 53.28^\circ \text{ kVA}$$

The input voltage is given by $V_S = S_S / I = 682.4 \text{ V (rms)}$

The power factor at the input is $\cos 53.28^\circ = 0.6$ Lagging

$$\begin{aligned}\text{(b) Applying KVL, } \bar{V}_S &= 480 \angle 0^\circ + j1.0(294.13 \angle -31.79^\circ) \\ &= 635 + j250 = 682.4 \angle 21.5^\circ \text{ V (rms)} \\ (pf)_S &= \cos(21.5^\circ + 31.79^\circ) = 0.6 \text{ Lagging}\end{aligned}$$

2.27 The circuit diagram is shown below:

$$\begin{aligned}P_{old} &= 50 \text{ kW}; \cos^{-1} 0.8 = 36.87^\circ; \theta_{OLD} = 36.87^\circ; Q_{old} = P_{old} \tan(\theta_{old}) \\ &= 37.5 \text{ kVAR}\end{aligned}$$

$$\therefore \bar{S}_{old} = 50,000 + j37,500$$

$$\begin{aligned}\theta_{new} &= \cos^{-1} 0.95 = 18.19^\circ; \bar{S}_{new} = 50,000 + j50,000 \tan(18.19^\circ) \\ &= 50,000 + j16,430\end{aligned}$$

$$\text{Hence } \bar{S}_{cap} = \bar{S}_{new} - \bar{S}_{old} = -j21,070 \text{ VA}$$

Phase voltage at sending end is given by

$$\bar{V}_1 = 2200 \angle 0^\circ + (0.4 + j2.7)(100 \angle -36.87^\circ) = 2401.7 \angle 4.58^\circ \text{ V}$$

The magnitude of the line to line voltage at the sending end of the line is

$$(V_1)_{L-L} = \sqrt{3}V_1 = \sqrt{3}(2401.7) = 4160 \text{ V}$$

(b) The three-phase complex-power loss in the line is given by

$$\begin{aligned}\bar{S}_{L(3\phi)} &= 3RI^2 + j3 \times I^2 = 3(0.4)(100^2) + j3(2.7)(100)^2 \\ &= 12 \text{ kW} + j81 \text{ kVAR}\end{aligned}$$

(c) The three-phase sending power is

$$\begin{aligned}\bar{S}_{S(3\phi)} &= 3\bar{V}_1\bar{I}^* = 3(2401.7 \angle 4.58^\circ)(100 \angle 36.87^\circ) \\ &= 540 \text{ kW} + j477 \text{ kVAR}\end{aligned}$$

$$\text{Note that } \bar{S}_{S(3\phi)} = \bar{S}_{R(3\phi)} + \bar{S}_{L(3\phi)}$$

2.45 (a)

$$I_S = \frac{S_S}{\sqrt{3}V_{LL}} = \frac{25.001 \times 10^3}{\sqrt{3}(480)} = 30.07 \text{ A}$$

(b) The ammeter reads zero, because in a balanced three-phase system, there is no neutral current.

2.46 (a)

Using voltage division: $\bar{V}_{AN} = \bar{V}_{an} \frac{\bar{Z}_{\Delta}/3}{(\bar{Z}_{\Delta}/3) + \bar{Z}_{LINE}}$

$$= \frac{208}{\sqrt{3}} \angle 0^\circ \frac{10 \angle 30^\circ}{10 \angle 30^\circ + (0.8 + j0.6)}$$

$$= \frac{(120.09)(10 \angle 30^\circ)}{9.46 + j5.6} = \frac{1200.9 \angle 30^\circ}{10.99 \angle 30.62^\circ}$$

$$= 109.3 \angle -0.62^\circ \text{ V}$$

Load voltage = $V_{AB} = \sqrt{3} (109.3) = 189.3 \text{ V Line-to-Line}$

(b)

$$\bar{Z}_{eq} = 10 \angle 30^\circ \parallel (-j20)$$

$$= 11.547 \angle 0^\circ \Omega$$

$$\bar{V}_{AN} = \bar{V}_{an} \frac{\bar{Z}_{eq}}{\bar{Z}_{eq} + \bar{Z}_{LINE}}$$

$$= \left(\frac{208}{\sqrt{3}} \right) \frac{11.547}{(11.547 + 0.8 + j0.6)}$$

$$= \frac{1386.7}{12.362 \angle 2.78^\circ} = 112.2 \angle -2.78^\circ \text{ V}$$

Load voltage Line-to-Line $V_{AB} = \sqrt{3} (112.2) = 194.3 \text{ V}$

$$\bar{V}_L = \bar{V}_{G1} - \bar{Z}_{LINE1} \bar{I}_{G1} = \frac{460}{\sqrt{3}} \angle 0^\circ - (1.4 + j1.6)(23.53 \angle -36.87^\circ)$$

$$= 216.9 \angle -2.73^\circ \text{ V Line to Neutral}$$

Load Voltage $V_L = \sqrt{3} 216.9 = 375.7 \text{ V Line to line}$

$$(b) \bar{I}_L = \frac{30 \times 10^3}{\sqrt{3}(375.7)(0.8)} \angle -2.73^\circ - \cos^{-1} 0.8 = 57.63 \angle -39.6^\circ \text{ A}$$

$$\begin{aligned} \bar{I}_{G2} &= \bar{I}_L - \bar{I}_{G1} = 57.63 \angle -39.6^\circ - 23.53 \angle -36.87^\circ \\ &= 34.14 \angle -41.49^\circ \text{ A} \end{aligned}$$

$$\begin{aligned} \bar{V}_{G2} &= \bar{V}_L + \bar{Z}_{LINE2} \bar{I}_{G2} = 216.9 \angle -2.73^\circ + (0.8 + j1)(34.14 \angle -41.49^\circ) \\ &= 259.7 \angle -0.63^\circ \text{ V} \end{aligned}$$

$$(b) pf = \cos 31.32^\circ = 0.854 \text{ Lagging}$$

$$(c) I_L = \frac{S_L}{\sqrt{3}V_{LL}} = \frac{26.93 \times 10^3}{\sqrt{3}(480)} = 32.39 \text{ A}$$

$$(d) Q_C = Q_L = 14 \times 10^3 \text{ VAR} = 3(V_{LL})^2 / X_\Delta$$

$$X_\Delta = \frac{3(480)^2}{14 \times 10^3} = 49.37 \Omega$$

$$(e) I_C = V_{LL} / X_\Delta = 480 / 49.37 = 9.72 \text{ A}$$

$$I_{LINE} = \frac{P_L}{\sqrt{3}V_{LL}} = \frac{23 \times 10^3}{\sqrt{3}480} = 27.66 \text{ A}$$

2.49 (a) Let $\bar{Z}_Y = \bar{Z}_A = \bar{Z}_B = \bar{Z}_C$ for a balanced Y-load

$$\bar{Z}_\Delta = \bar{Z}_{AB} = \bar{Z}_{BC} = \bar{Z}_{CA}$$

Using equations in Fig. 2.27

$$\bar{Z}_\Delta = \frac{\bar{Z}_Y^2 + \bar{Z}_Y^2 + \bar{Z}_Y^2}{\bar{Z}_Y} = 3\bar{Z}_Y$$

and

$$\bar{Z}_Y = \frac{\bar{Z}_\Delta^2}{\bar{Z}_\Delta + \bar{Z}_\Delta + \bar{Z}_\Delta} = \frac{\bar{Z}_\Delta}{3}$$

$$(b) \bar{Z}_A = \frac{(j10)(-j25)}{j10 + j20 - j25} = -j50 \Omega$$

$$\bar{Z}_B = \frac{(j10)(j20)}{j5} = j40 \Omega; \bar{Z}_C = \frac{(j20)(-j25)}{j5} = -j100 \Omega$$

2.50 Replace delta by the equivalent WYE: $\bar{Z}_Y = -j\frac{2}{3} \Omega$

Per-phase equivalent circuit is shown below:

Noting that $\left(j1.0 \parallel -j\frac{2}{3} \right) = -j2$, by voltage-divider law,

$$\bar{V}_1 = \frac{-j2}{-j2 + j0.1} (100\angle 0^\circ) = 105\angle 0^\circ$$

$$\therefore v_1(t) = 105\sqrt{2} \cos(\omega t + 0^\circ) = 148.5 \cos \omega t \text{ V} \leftarrow$$

In order to find $i_2(t)$ in the original circuit, let us calculate $\bar{V}_{A'B'}$

$$\bar{V}_{A'B'} = \bar{V}_{A'N'} - \bar{V}_{B'N'} = \sqrt{3} e^{j30^\circ} \bar{V}_{A'N'} = 173.2\angle 30^\circ$$

Then
$$\bar{I}_{A'B'} = \frac{173.2\angle 30^\circ}{-j2} = 86.6\angle 120^\circ$$

$$\begin{aligned} \therefore i_2(t) &= 86.6\sqrt{2} \cos(\omega t + 120^\circ) \\ &= 122.5 \cos(\omega t + 120^\circ) \text{ A} \leftarrow \end{aligned}$$

2.51 On a per-phase basis $\bar{S}_1 = \frac{1}{3}(150 + j120) = (50 + j40) \text{ kVA}$

$$\therefore \bar{I}_1 = \frac{(50 - j40)10^3}{2000} = (25 - j20) \text{ A}$$

Note: PF Lagging

Load 2: Convert Δ into an equivalent Y

$$\bar{Z}_{2Y} = \frac{1}{3}(150 - j48) = (50 - j16) \Omega$$

$$\begin{aligned} \therefore \bar{I}_2 &= \frac{2000 \angle 0^\circ}{50 - j16} = 38.1 \angle 17.74^\circ \\ &= (36.29 + j11.61) \text{ A} \end{aligned}$$

Note: PF Leading

$$\bar{S}_3 \text{ per phase} = \frac{1}{3}[(120 \times 0.6) - j120 \sin(\cos^{-1} 0.6)] = (24 - j32) \text{ kVA}$$

$$\therefore \bar{I}_3 = \frac{(24 + j32)10^3}{2000} = (12 + j16) \text{ A}$$

Note: PF Leading

Total current drawn by the three parallel loads $\bar{I}_T = \bar{I}_1 + \bar{I}_2 + \bar{I}_3$

$$\bar{I}_{TOTAL} = (73.29 + j7.61) \text{ A}$$

Note: PF Leading

$$\text{Voltage at the sending end: } \bar{V}_{AN} = 2000 \angle 0^\circ + (73.29 + j7.61)(0.2 + j1.0)$$

$$= 2007.05 + j74.81 = 2008.44 \angle 2.13^\circ \text{ V}$$

$$\text{Line-to-line voltage magnitude at the sending end} = \sqrt{3}(2008.44) = 3478.62 \text{ V} \leftarrow$$

2.52 (a) Let \bar{V}_{AN} be the reference: $\bar{V}_{AN} = \frac{2160}{\sqrt{3}} \angle 0^\circ \approx 2400 \angle 0^\circ \text{ V}$

$$\text{Total impedance per phase } \bar{Z} = (4.7 + j9) + (0.3 + j1) = (5 + j10) \Omega$$

$$\therefore \text{Line Current} = \frac{2400 \angle 0^\circ}{5 + j10} = 214.7 \angle -63.4^\circ \text{ A} = \bar{I}_A \leftarrow$$

With positive A-B-C phase sequence,

$$\bar{I}_B = 214.7 \angle -183.4^\circ \text{ A}; \bar{I}_C = 214.7 \angle -303.4^\circ = 214.7 \angle 56.6^\circ \text{ A} \leftarrow$$
